

Python for Marketing

with Lavanya Vijayan

Install Applications for this course

You will be using a command line interface to install the applications you need for the course. The default command-line interface for the Mac operating system is the **terminal**. The command-line interface for Windows, Linux, and any Unix-based operating systems is **bash**.

Open up the command-line interface on your system and make sure it loads.

First Installation: Python

To set up Python, go to <https://www.python.org/downloads>.

Click on the button to download the latest version of the Python installer.

Once the download is complete, locate the Python installer file. Double-click on the file to run the installation process.

To verify that Python was successfully installed, you can run the following command in the command line.

```
Unset  
python3 --version
```

Second Installation: Pip

The next tool to install is pip, which is a package manager for Python. It allows you to install and manage packages that aren't part of the Python standard library.

To install pip, run the following command through the command line.

```
Unset  
sudo python3 get-pip.py
```

Python for Marketing

with Lavanya Vijayan

Third Installation: JupyterLab

JupyterLab is a versatile coding environment that is often used for working on data science projects.

You'll be using JupyterLab throughout the course.

To install JupyterLab, run the following command through the command line.

```
Unset  
pip3 install jupyterlab
```

After it's been installed, you can start JupyterLab by executing the following command through the command line.

```
Unset  
jupyter-lab
```

JupyterLab will open automatically in your browser.

Fourth Installation: Pandas

Pandas is a Python library for data manipulation and analysis.

You'll be using pandas throughout the course.

To install pandas, run the following command through the command line.

```
Unset  
pip3 install pandas
```

Fifth Installation: Matplotlib

Matplotlib is a Python library for creating data visualizations.

To install matplotlib, run the following command through the command line.

```
Unset  
pip3 install matplotlib
```

Sixth Installation: Seaborn

Seaborn is a Python library that's built on top of matplotlib and used for creating advanced visualizations, including informative statistical graphics, for complex datasets.

To install seaborn, run the following command through the command line.

```
Unset  
pip3 install seaborn
```

Seventh Installation: Numpy

Numpy is a Python library that helps you efficiently create arrays and perform a wide variety of mathematical operations on them.

To install numpy, run the following command through the command line.

```
Unset  
pip3 install numpy
```

Eighth Installation: Scipy

Scipy is a Python library that's built on top of numpy and provides more functions for scientific computing, including optimization, statistical operations, and signal processing.

To install scipy, run the following command through the command line.

Unset

```
pip3 install scipy
```
